Here, we can observe that, dividing a whole number 6 by a fraction $\frac{1}{2}$ is the same as multiplying a whole number 6 by 2, where 2 is the ***reciprocal*** of $\frac{1}{2}$. Generally, dividing a number by a fraction is the same as multiplying that number by the reciprocal of the fraction.

Let us discuss the same situation in another way. Let us take a bar of length $12\,cm$

How many $2\,cm$ bars are there in a $12\,cm$ bar?

Now find how many $\frac{1}{2}$ cm bars are there in a $12\ cm$ bar?

Let us observe and complete the following:

i) $\frac{3}{7}\times\frac{7}{3}=\frac{21}{21}=1$ ii) $\frac{1}{9}\times 9=\frac{9}{9}=1$ iii) $8\times\frac{1}{8}=\frac{8}{8}=?$ iv) $\frac{13}{4}\times ?=1$ v) $\frac{4}{3}\times ?=1$

From the above, we can see that ***the Product of a fraction and its reciprocal is always 1***.

Example 19 Kandan shares $\frac{1}{2}$ piece of a cake between 2 persons. What will be the share of each?

Solution To know the share, we need to find $\frac{1}{2}\div 2$

$$\frac{1}{2}\div 2=\frac{1}{2}\times\frac{1}{2}\ \text{(reciprocal of 2 is } \frac{1}{2})$$

$$=\frac{1}{2}\times\frac{1}{2}=\frac{1\times 1}{2\times 2}=\frac{1}{4}$$

Example 20 Divide $4\frac{1}{2}$ by $3\frac{1}{2}$

Solution $4\frac{1}{2}\div 3\frac{1}{2}=\frac{9}{2}\div\frac{7}{2}$

$$=\frac{9}{2}\times\frac{2}{7}\ \text{(reciprocal of } \frac{7}{2} \text{ is } \frac{2}{7})$$

$$=\frac{9}{7}$$

Try these

i) How many 6s are there in 18?

ii) How many $\frac{1}{4}$ s are there in 5?

iii) $\frac{1}{3}\div 5=?$

Example 21 An oil tin contains $7\frac{1}{2}$ litres of oil which is poured in $2\frac{1}{2}$ litres bottles. How many bottles are required to fill $7\frac{1}{2}$ litres of oil?

Solution The number of bottles required = $\frac{15}{2}\div\frac{5}{2}=\frac{15}{2}\times\frac{2}{5}$ (reciprocal of $\frac{5}{2}$ is $\frac{2}{5}$)

= 3 bottles
