2.2.1 More situations on Integers

			
An aeroplane is flying at a height of 5,000m above the sea level and a submarine is at 200m below sea level.	The height of the peak Mt.McKinley is 20,310 feet above the sea level and the death valley is 282 feet below the sea level.	The depth at which sharks are found in the deep sea say at 800 m below the sea level.	The temperature at the hill station Oymyakon, the coldest place in Russia going – 45°C below 0°C.

Activity

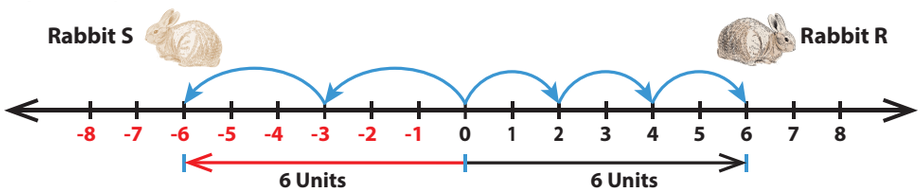

Ask your parents / grandparents about the depth at which the various types of vegetables (seeds) should be planted, for their better and efficient growth. For the same, draw a number line indicating the depth of various vegetable seeds. (Draw the planting chart!).

2.2.2 Opposite of a number

The idea of opposite of a number is not a new one. A few situations like, a man makes a profit of ₹500 or he loses ₹500 by selling an article; credit and debit of ₹75000 in a cash transaction of a business are 'opposite' to each other.

Think about the situation

Suppose two rabbits R and S jump along a number line (like) on the opposite sides of 0. Rabbit R jumps 2 steps 3 times to the right of 0 and Rabbit S jumps 3 steps 2 times to the left of 0 as shown in the figure below. Where will both of them stand on the number line? Are they at equal distance from 0?

Clearly, the rabbit R stands at 6 and the rabbit S stands at −6 on the number line. The distance from 0 to 6 on the number line is 6 units and the distance from 0 to −6 on the number line is also 6 units.The numbers 6 and −6 are at the same distance from 0 on
