9. How many different rectangles can be made with a 48 *cm* long string? Find the possible pairs of length and breadth of the rectangles.

10. Draw a square B whose side is twice of the square A. Calculate the perimeters of the squares A and B.

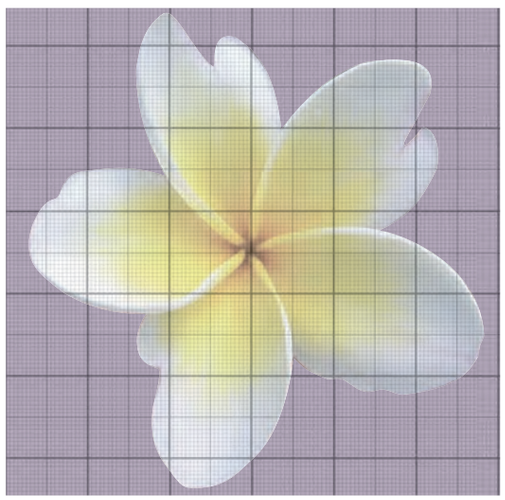

11. What will be the area of a new square formed if the side of a square is made one-fourth?

12. Two plots have the same perimeter. One is a square of side 10 *m* and another is a rectangle of breadth 8 *m*. Which plot has the greater area and by how much?

13. Look at the picture of the house given and find the total area of the shaded portion.

14. Find the approximate area of the flower in the given square grid.

Summary

- The perimeter of any closed figure is the total length of its boundary.
- Perimeter of the rectangle, P= 2 x (l + b) *units*.
- Perimeter of the square, P = (4 x S) *units*.
- Perimeter of the triangle, P = (a + b + c) *units*.
- Perimeter of the shape with equal sides = Number of sides x Length of a side.
- The area is the measure of the region/surface occupied by a closed figure.
- Area of a rectangle, A = length x breadth = (l x b) *sq. units*.
- Area of a square, A = side x side = (s x s) *sq. units*.
- Area of the right angled triangle, A = $\frac{1}{2}$ (b x h) *sq. units*.
- The perimeter of a combined shape is the sum of the length of all outer sides of the shapes.
- The area of a combined shape is the sum of all the areas of regular/simpler shapes by which the combined shape is formed.
