

Euglena

Euglena is an unicellular animal which moves with a flagellum.

2. Multicellular organisms

Majority of organisms we see around us, including animals are multicellular. In such organisms, different functions are carried out by different groups of cells or organs in their body. E.g. Jelly fish, Earth worm, snails, fish, frog, snakes, pigeon, tiger, monkey and man.

Table 1 The differences between Unicellular and Multicellular Organisms.

Unicellular Organism	Multicellular Organism
❖ They are made up of a single cell.	❖ They are organisms that are made up of many cells.
❖ They can perform all the functions of life.	❖ Division of labour exists among cells. Different cells are specialized to perform different functions.
❖ These organisms are generally very small (microscopic) in size.	❖ They are mostly large in size. They are seen through naked eye.
❖ They lack tissues, organs and organ systems.	❖ They are composed of tissues, organs and organ systems.
❖ Growth occurs by an increase in the size of the cells.	❖ Growth occurs by an increase in the number of cells by cell division.
Eg. *Amoeba, Paramecium* and *Euglena*.	Eg. Earthworm, Fish, Frog, Lizard and human being.
