Introduction

What is a change?

The process in which something becomes different from what it was earlier? It is the observable difference between initial state and the final state of any substance.

Change is the law of nature. In our day - to - day life we see many changes around us. Weather changes periodically (daily/ seasonly), season change periodically. A paper burns readily while it takes a few days for an iron nail to rust. It takes a few hours for milk to turn into curd but vegetables get softened in a few minutes when cooked.

The what happense during a change? said changes are accompanied by change in properties like shape, colour, temperature, position and composition. Some changes can be observed while some are not possible to notice.

Can you list some of the changes that you have observed in your daily life?

Activity 1: What happens when you blow air into a balloon?

- Is there any change in size?
  ☐ Yes ☐ No
- Is there any change in shape?
  ☐ Yes ☐ No
- Is there any other change?

_____

3.1 Classification of Changes

A2EQT6

There are different types of changes that occur around us. Some changes take place very quickly while others take hours, days or even years. Some changes are temporary while some others are permanent. Some changes produce new substances while others do not. Some changes are natural while others are made by human beings. Some changes are desirable to us but some changes are not desirable.

We shall now try to classify changes on the basis of certain similarities and differences.

- **slow and fast changes**
- **reversible and irreversible changes**
- **physical and chemical changes**
- **desirable and undesirable changes**
- **natural and man - made changes**
