Introduction

Organ systems are formed by the association of organs which are organized from tissues. This kind of organization helps the organism to perform various activities more efficiently. A group of organs that work together to perform a particular function is known as an **organ system.** The Human body has eight major organ systems. They are

❖Skeletal System ❖Muscular System

❖Digestive System ❖Respiratory System

❖Circulatory System ❖Nervous System

❖Endocrine System ❖Excretory System

In this lesson, let us study more about the structure and function of these organ systems of our body.

6.1 Skeletal System

The skeletal system consists of bones, cartilages and joints. Bones provide a frame work for the body. Bones along with muscles help in movements such as walking, running, chewing and dancing etc.,

The adult human skeletal system consists of 206 bones and few cartilages, ligaments and tendons. Ligaments help in connecting bone to bone. Tendons connect bone to muscle. The two major divisions of the skeletal system are **Axial skeleton and Appendicular skeleton.**

Axial skeleton forms the upright axis of the body which includes

- ❖ **Skull**
- ❖ **Vertebral column**
- ❖ **Rib cage**

A51KAM

Appendicular skeleton consist of the bones of the limbs along with their pectoral and pelvic girdles.

Activity 1: Sit absolutely still. Observe the movements taking place in your body. You must be blinking your eyes time to time. Observe the movements in your body as you breathe. Write down the movements in your note book.

We are able to move a few parts of our body easily in various directions and some, only in one direction. Why we are not able to move some parts at all directions?

Skull

The skull is made up of cranial bones and facial bones. It protects the brain and the structures of the face. The hyoid bone present at the base of the buccal cavity and the auditory ossicles (Malleus, Incus and Stapes) are also included in the skull. Lower jaw bone is the largest and strongest bone in the human face.
