The Water distribution and water treatment system

Let us avoid wasting water

When you happen to see any leaking tap in your school or home, keep a bucket to collect the water that is leaking and measure the amount of water and the time taken to fill the bucket. After noting the time taken to fill a bucket, you can estimate the amount of water getting wasted on a day.

Can you please think over the amount of water getting wasted all around the world from the leaking taps?

Points to remember

- Water is one of the most important components that all animals including human beings and plants depend on for their livelihood.
- To an extent of 97% of the total water that exists on Earth is found in seas and oceans.
- Only 3% of the freshwater is available in polar ice caps and glaciers.
- Lakes, rivers, swamps constitute only 0.3% of the surface water.
- The moisture in the soil indicates the presence of underground water.
- The continuous circulation of water in nature is called the water cycle. It is effected by evaporation, condensation, precipitation and transpiration.
- Ground water is the water present beneath Earth's surface in soil.
