DO YOU KNOW?

Aquarium:

Aquarium is a place in which fish and other water creatures and plants are maintained. An aquarium can be a small tank, or a large building with one or more large tanks.

Terrarium:

Terrarium is a place in which live terrestrial animals as well as plants are maintained. With controlled conditions that copy their natural environment

Aquariums and Terrariums are used to observe animals and plants more closely. They are also used for decorations.

4.2 Food Chain and Food Web

EGVY6C

Living organisms need food to perform their physiological activities. Some organisms can produce their own food, such as plants, while other organisms cannot do this and depends on other organisms to obtain their food.

We can therefore identify different feeding types of mechanisms in an ecosystem, based on how the organism obtain (gets) their food. They are **producers and consumers.**

Producers

Producers are organisms that are able to produce their own food. They do not need to eat other organisms. Producers are also called **autotrophs.** Can you name an organism that prepare it's own food?

Plants are producers because they make their own food by photosynthesis.

What do plants require for photosynthesis?

Consumers

Organisms which cannot produce their own food, has to eat other organisms as food. These organisms are called **consumers.** All animals are consumers as they cannot produce their own food. Consumers are also called **heterotrophs.**
