What are the ornamental plants grown in your locality?

Floriculture

5.7 Interrelationship between plants and animals

Animal-plant Interactions

EIZ1JI

Animals rely on plants for their food and shelter. This relationship benefits not only animals but also plants. Such relationship is economically significant.

For example, silkworms feed on mulberry leaves and live on mulberry plants. This relationship between a worm and a plant is economically useful for us in silk production.

Silk worm

Animals, pests, and birds are essential for **cross-pollination** of flowers.

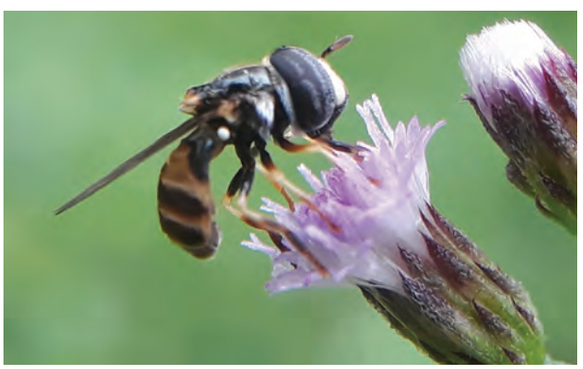

Bright colours of flowers, smell and honey attract insects. As the insects go from one flower to another, they leave the pollen grains from their body. This results in cross-pollination and the formation of vegetables and fruits.

Humming Bird

These insect pollinators and birds need to be protected to produce the best yield.

Bees are the best pollinators. They also give us honey.

Honey bee

Plants and algae living in coral reefs are the food for variety of fishes. Fisheries work is done in these areas.
