Introduction

Computer is a device comprising both hardware and software. The functions of hardware and software combines together to make the Computer functional. A hardware device helps to enter input information. The software processes the input data and gives the output in the monitor, a hardware device. Thus computer is like a human body, where human body is the hardware and soul is the software.

6.1 Hardware

Hardware

Hardware is the parts of the computer which we can touch and feel. Hardware includes Input and Output devices, Cabinet, Hard Disk, Mother Board, SMPS, CPU, RAM, CD Drive and Graphics Card.

6.2 Software

Hardware is lifeless without software in a computer. Software are programmed and coded applications to process the input information. The software processes the data by converting the input information into coding or programmed language. Touching and feeling the software is not possible but we can see the functions of the software in the form of output.

Software

Email existed before the World Wide Web.

6.3 Types of Software

The software is divided into two types based on the process. They are

1. System Software (Operating System)
2. Application software

6.3.1 System Software

System Software (Operating system) is software that makes the hardware devices process the data inputted by the user and to display the result on the output devices like Monitor. Without the operating system, computer cannot function on its own. Some of the popular operating system are Linux, Windows, Mac, Android etc.
