B.ON THE BASIS OF DEVELOPMENT:

Based on the **level of development**, resources can be divided into actual and potential resources.

i. **Actual resources** are resources that are being used and the quantity available is known. (e.g.) Coal at Neyveli.

ii. **Potential resources** are resources that are not being used in the present and its quantity and location are not known. The technology to extract such resources is also yet to be developed. (e.g.) Marine yeast found in the Bay of Bengal and Arabian Sea.

DO YOU KNOW?

Marine yeast have greater potential than the terrestrial yeast. They can be used in baking, brewing, wine, bio-ethanol and pharmaceutical protein production.

C. ON THE BASIS OF EXHAUSTIBILITY:

On the basis of **renewability** resources can be classified as renewable resources and non-renewable resources.

i. Resources once consumed can be renewed with the passage of time are called **renewable resources**. (e.g.) Air, Water, Sunlight. Misuse of such resources can also limit its available quantity. So, they have to be used wisely.

ii. Natural resources which are limited can be called **non-renewable** resources. They become exhausted after use and the time they take to replace does not match the life cycle. (e.g.) Coal, petroleum, natural gas and other minerals.

HOTS:

Find out what other resources can renew themselves?

Neyveli lignite corporation

The resources which cannot renew themselves are either scarce or totally absent. So man is in search of new resources and is conducting several researches. He confirms that a substance is a resource only after research. He tries to harness it and also searches the regions where it may be found in. They are potential resources. Wind energy is one such example. The places where the wind energy can be utilized are still unknown.

Wind energy
